

MARKETING OS

The AI Employee Every SMB Can Afford

An AI copilot that reads a business's own knowledge, replies to leads, segments customers, and writes campaigns — with a human always in the loop.

SMBs Are Drowning in Conversations They Can't Keep Up With

Every small or medium business today runs its front line — sales inquiries, customer questions, pricing requests, follow-ups — through WhatsApp, Instagram DMs, email, and phone. The volume keeps growing. The team answering it doesn't.

What this actually looks like for an SMB owner

- 100+ WhatsApp messages a day, answered manually, often hours late
- Leads lost simply because nobody replied fast enough
- No memory of past conversations — every reply starts from zero
- Pricing, policies, and offers repeated by hand, every single time
- Hiring a full-time support person is too expensive for a 5-person business

The cost of slow replies is not hypothetical

Businesses that respond to a lead within 5 minutes are dramatically more likely to convert it than those that take an hour — and most SMBs, without dedicated staff, take far longer than that. Every hour of delay is quietly lost revenue.

Why existing tools don't solve this

Generic chatbot builders (available inside platforms like GoHighLevel) require the business owner to manually write prompts, manage a knowledge base, and hope the bot doesn't hallucinate pricing. Hiring a virtual assistant is expensive and doesn't scale with message volume. Neither option is built for the specific job of "reply accurately, using only what this business actually told you, and know when to hand off to a human."

An AI Employee, Grounded in the Business's Own Knowledge

Marketing OS lets an SMB owner upload their own documents — price lists, FAQs, policies, service menus — and get an AI that replies to leads using only that information. Every reply is reviewed and approved before it reaches the customer, so trust is never gambled on an AI guess.

The core loop

- Owner uploads documents once (PDF, DOCX, spreadsheets, plain text)
- A lead messages in — the AI drafts a reply grounded in that knowledge, using the full conversation history for context
- The owner approves, edits, or rejects the draft in one tap — nothing is sent without a human decision
- Leads are automatically segmented (VIP / Hot / Cold) based on real engagement, not guesswork
- The owner asks for a campaign — e.g. "re-engage inactive customers" — and gets AI-written copy targeted at that exact segment

Without Marketing OS	With Marketing OS
✗ Manual replies, hours behind ✗ No memory across conversations ✗ Generic, un-grounded chatbots ✗ Manual, spreadsheet segmentation ✗ Campaigns written from scratch each time	✓ AI drafts replies in seconds ✓ Full conversation history in every reply ✓ Grounded strictly in the business's own data ✓ Automatic, explainable segmentation ✓ One-prompt, targeted campaign generation

What's Actually Built Today

This is not a concept — the full product below is built and functioning end-to-end.

1 • Knowledge Base

The owner uploads business documents (PDF, DOCX, Markdown, CSV, TXT). The system parses them, preserves tables and structure, and indexes them for retrieval — this becomes the single source of truth the AI is allowed to speak from.

2 • Lead Inbox (CRM)

Every lead has a profile and a conversation history, organized the way a real CRM works: Lead → Conversation → Message, with lead status and source tracked automatically.

3 • AI Reply Agent

When a message comes in, the system retrieves the most relevant knowledge, pulls in recent conversation history and the business's tone/hours/contact settings, and generates a single grounded reply — never sent automatically, always queued for approval.

4 • Customer Segmentation

Leads are automatically tagged VIP, Hot, or Cold using transparent, explainable rules — conversation frequency, recency, and status — so the owner always knows why a customer was tagged a certain way.

5 • Campaign Generator

The owner picks a segment and a goal ("win back inactive customers," "thank our VIPs"), and the AI drafts ready-to-send campaign copy — reviewed and approved the same way replies are.

6 • Business Profile

Tone of voice, business hours, contact details, and escalation rules are set once and automatically shape every AI-generated reply and campaign — so the AI sounds like the business, not like a generic bot.

Every AI action is a draft until a human says otherwise

This is a deliberate design choice, not a limitation. No reply and no campaign reaches a real customer without explicit approval. That single decision is what makes the product usable by trust-sensitive businesses — clinics, agencies, service providers — from day one.

Three Curves Are Crossing at the Same Time

1. LLMs became cheap and reliable enough to run a real business function

Grounded, retrieval-based AI replies were prohibitively expensive and unreliable two years ago. Today, a single well-engineered reply costs a fraction of a cent and can be measured for accuracy — this product would not have been economically viable even 18 months earlier.

2. SMBs are digitizing faster than software is reaching them

Pakistan alone has over 3.2 million business establishments, contributing 25% of the country's exports, with internet penetration still climbing past 45%. The digital-commerce layer (payments, messaging, social selling) is maturing fast — the AI layer on top of it is not.

3. The AI customer-service category is entering its steep growth phase

The global AI customer service market is projected at \$15.12B in 2026, growing at roughly 25.8% CAGR — and the broader conversational AI market is expected to more than quadruple by the early 2030s. Enterprise players are moving fast; the SMB tier remains comparatively underserved and price-sensitive in exactly the way a lean, focused product can win.

TAM / SAM / SOM

TAM — Total Addressable Market

The global SMB software market is valued at approximately \$79.8B in 2026, growing to over \$150B by 2035 (7.4% CAGR). Within it, the AI customer-service and conversational-AI segment specifically is valued at \$15.1B in 2026, growing at roughly 25.8% CAGR — the fastest-growing slice of SMB software spend.

SAM — Serviceable Addressable Market

SMBs in Pakistan and South Asia that run customer-facing conversations at volume — clinics, agencies, salons, e-commerce sellers, service businesses — and are already active on WhatsApp, Instagram, or similar channels. Pakistan alone has 3.2 million business establishments; even a narrow first slice of message-heavy, digitally-active SMBs represents a market in the hundreds of thousands of businesses.

SOM — Serviceable Obtainable Market (3-Year Target)

A realistic 3-year target is a few thousand paying SMB customers across Pakistan and South Asia, expanding into English-speaking global SMB markets once the product and support motion are proven domestically — mirroring how other vertical SaaS products have used a home market as a proving ground before international expansion.

Infrastructure vs. Intelligence

Platforms like GoHighLevel and Twilio are not competitors — they are infrastructure. They move messages. They do not understand a business's own pricing, policies, or tone well enough to reply on its behalf without heavy manual setup. Marketing OS is designed to sit on top of that infrastructure, not replace it.

	GoHighLevel / Twilio (Infra)	Generic Chatbot Builders	Marketing OS
What it is	Messaging pipes & CRM plumbing	DIY prompt + flow builder	Grounded AI employee
Needs manual prompt engineering	N/A	Yes, extensive	No — learns from uploaded docs
Grounded in business's own data	No	Only if self-built	Yes, by default (RAG)
Human-approval workflow built in	No	Rare	Yes, every reply & campaign
Explainable customer segmentation	Basic tags	No	Yes, rule-based & transparent
Setup complexity for owner	Low (but dumb)	High	Low (upload & go)

Positioning: the intelligence layer, not another inbox

The strategy is deliberately not to rebuild WhatsApp integration, ticketing, or CRM plumbing from scratch. Those problems are already solved well by GoHighLevel, Twilio, and similar platforms. Marketing OS's differentiation is the layer those platforms don't provide: grounded, approval-gated AI reasoning over a specific business's own knowledge — with segmentation and campaigns built on top of the same data.

Subscription SaaS, Priced for SMB Budgets

Recurring monthly subscription tiers, structured around usage (AI replies generated, documents indexed, team seats) rather than per-message pricing — so a growing business's bill grows predictably, not unpredictably.

Tier	Target Customer	What's Included
Starter	Solo owner / very small team	1 knowledge base, core Reply Agent, basic segmentation
Growth	Small teams, higher message volume	Multiple team members, campaign generator, priority support
Business	Multi-location / agency-managed accounts	Multiple businesses under one account, advanced analytics, integrations

Additional revenue levers

- Usage add-ons: extra AI reply credits, extra documents/storage
- Channel add-ons: WhatsApp Business number provisioning, additional integrations
- Agency/reseller tier: agencies managing multiple SMB clients from one dashboard

Land in One Vertical, Prove It, Then Expand

Rather than launching as a generic "AI for every business," the go-to-market plan focuses on a small number of high-message-volume verticals first — where the pain (too many messages, not enough hands) is sharpest and the knowledge base (a price list, a service menu) is simple to set up.

Phase 1 — Beachhead verticals (Pakistan)

- Dental & medical clinics — appointment questions, pricing, high WhatsApp volume
- Marketing & digital agencies — client inquiries, proposal follow-ups
- Instagram/WhatsApp-native sellers — product questions, order status

Phase 2 — Expand across South Asian SMB segments

Once repeatable onboarding and support processes are proven in the beachhead verticals, expand horizontally to adjacent SMB categories (salons, real estate, education) within the same region.

Phase 3 — Global SMB expansion

Take the proven playbook to English-speaking SMB markets, where WhatsApp Business and similar tools are already standard and AI-support willingness is high.

Early acquisition channels

- Direct outreach to agency owners and clinic operators (founder-led sales, first cohort)
- Partnerships with agencies who already manage marketing for multiple SMBs (reseller motion)
- Content and case studies showing measurable response-time and conversion improvements

What's Been Built and Validated So Far

Product

- Full end-to-end MVP built and functioning: authentication, knowledge base with real document ingestion, CRM, AI Reply Agent, segmentation, campaign generator, and a complete web dashboard
- Production-hardening underway: rate limiting, revocable refresh tokens, monitoring/observability (LangSmith tracing) wired into every AI call
- A major performance fix reduced AI reply latency from 9–16 seconds down to 1–2 seconds, and document upload time from roughly 4 minutes to a few seconds — the product is fast enough for real-time customer conversations

Evaluation & quality

- Baseline retrieval-quality evaluation completed using RAGAS — confirming the core pipeline answers correctly when the right information exists, and does not fabricate answers when it doesn't
- A concrete retrieval-accuracy gap was already identified and scoped for the next hardening pass (corrective retrieval) — the team is measuring quality, not assuming it

What's next (in motion)

- Corrective RAG: the system will self-check retrieval confidence and escalate to a human rather than guess
- Real lead-source integration (starting with a CRM/WhatsApp integration) to replace manual test data with live leads
- Web-search-augmented campaign generation for fresher, more current marketing copy

Built for Reliability, Not Just a Demo

Architecture highlights

- Multi-tenant from the ground up: every table and every vector-store query is scoped by organization — one business's data structurally cannot leak into another's
- Retrieval and generation are cleanly separated — no duplicate or wasted LLM calls, which keeps operating cost per reply low
- Every AI-authored reply or campaign is a reviewable draft, never an autonomous send — a deliberate trust-by-design choice
- Full observability: every AI call is traced for latency, cost, and output, not a black box

Where the durable moat comes from

- Retrieval quality that's measured, not assumed — an evaluation pipeline (RAGAS/DeepEval) that scores faithfulness and relevancy on every material change, so quality improves on evidence
- Corrective RAG — the system recognizes when it doesn't know something and hands off, instead of confidently guessing — directly addressing the #1 reason SMB owners don't trust AI with customers
- Deep vertical workflows (segmentation, campaigns, approval flows) purpose-built for SMB operations, which a general-purpose chatbot platform is structurally not optimized to replicate

Why this is hard to copy quickly

Any team can wire an LLM to a vector database in a weekend. Making that reliable enough for a business to trust with real customers — multi-tenant security, latency under load, measured accuracy, graceful escalation when the AI isn't sure — is the actual engineering problem, and it's the one this team has already been solving in production, not in a slide.

Where the Product Goes From Here

Horizon	Focus	Key Outcomes
Now → 3 months	Reliability & evaluation	Corrective RAG live, evaluation pipeline running continuously, production hardening across all modules
3 → 6 months	Real lead sources	Live CRM/WhatsApp lead integration replacing manual test data; first paying pilot customers
6 → 12 months	Intelligence upgrades	Web-search-augmented campaigns, expanded segmentation, agentic tool-use for more complex requests
12 → 24 months	Scale & expansion	Multi-vertical expansion within South Asia, groundwork for global SMB markets, agency/reseller channel

Founder

Syed Mudaser Mazhar — Founder & Builder

- BS Data Science student, Virtual University of Pakistan
- ML/AI Engineering intern at FlyRank AI (US-based remote company)
- Founder of RevAuto, an AI automation agency serving SMB clients directly — meaning the problem this product solves was first observed firsthand, not researched secondhand
- Personally designed and built the entire Marketing OS stack — backend architecture, RAG pipeline, multi-tenant security, and frontend — end to end

Why this founder, why this problem

Building and running an AI automation agency for real SMB clients surfaced this exact gap firsthand: every client needed grounded, trustworthy AI replies, and no existing tool made that easy to deliver. Marketing OS is the product that experience made obvious was missing.

Pre-Seed Round

Raising a pre-seed round to take Marketing OS from a working, production-hardened MVP to a live product with paying SMB customers across the initial beachhead verticals.

Use of funds

- Product: complete corrective RAG, live lead-source (WhatsApp/CRM) integration, and continuous evaluation infrastructure
- Go-to-market: founder-led sales into the beachhead verticals, first case studies, early agency partnerships
- Infrastructure: production deployment, monitoring, and support tooling to onboard the first paying cohort reliably
- Team: first hires in engineering and customer success to support onboarding and retention

What success looks like at the next milestone

- A validated, repeatable onboarding motion in at least one beachhead vertical
- A measured, improving accuracy/reliability track record (not just a working demo)
- A first cohort of paying SMB customers with retained usage — the evidence needed for a seed round

Thank you for reading.

Let's talk about what an AI employee could do for every SMB.
